

Grade 12 Chemistry Final Exam Answer Key

Part A - Multiple Choice

1. b
2. b
3. b
4. b
5. b
6. d
7. c
8. e
9. a
10. d
11. d
12. e
13. c
14. b
15. c
16. b
17. c

Part B - Written Answers (Key Summaries)

1. a) Reactants + Heat $\rightarrow$ Products

b) Exothermic

c) Enthalpy diagram shows reactants at higher energy level than products, $\Delta H = -257.2 \text{ kJ}$

d) Moles = $23.6 \text{ g} / 98 \text{ g/mol} = 0.241 \text{ mol}$; $\Delta H = 0.241 \text{ mol} \times -257.2 \text{ kJ/mol} \sim -62.0 \text{ kJ}$

2. $q = mc\Delta T \rightarrow m = q / (c\Delta T) = 23400 \text{ J} / (2.46 \times 14.2) \sim 671 \text{ g}$

3. Use $q_{\text{water}} = mc\Delta T \rightarrow q = 225 \times 4.18 \times 1.7 \sim 1599 \text{ J}$; $c = q / (m\Delta T) = 1599 / (55 \times (99 - 22)) \sim 0.38 \text{ J/g}^\circ\text{C}$

4. $I_2 = 0.450 \text{ M} \rightarrow H_2 = 0.450 \text{ M}$; $K_c = [H_2][I_2]/[HI]^2 = 0.2 \rightarrow$ solve for $[HI]$: $[HI] = \sqrt{(0.45 \times 0.45)/0.2} \sim 0.71$

M

5. a) Right shift

b) Left shift

c) No effect

d) Right shift (Le Chatelier)

6. Hess's Law $\rightarrow$ Use 3 given reactions to derive: $\Delta H = 2 \times (174.1) - 2 \times (76.6) - 2 \times (285.5) = -27.8 \text{ kJ}$

7. $\Delta T = q / (mc) = 4080 / (212 \times 0.385) \sim 50 \text{ degrees C}$

8. a) U: $[\text{Rn}]5f^3 6d^1 7s^2$

b) Bi: $[\text{Xe}]4f^{14} 5d^{10} 6s^2 6p^3$

9. VSEPR shapes, polarity and angles:

FCl_2^+ : Bent; NO_3^- : Trigonal planar; PI_5 : Trigonal bipyramidal; SO_3 : Trigonal planar

10. a) $3p^5$: Period 3, Group 17, p-block

b) $4d^5$: Period 5, Group 7, d-block

11. Name: 5-isopropyl-4,6-dimethyloctan-3-ol

Condensed: $\text{C}_6\text{H}_5\text{CH}(\text{CH}_3)_2$

12. Drawn line structures for given compounds

13. a) Ketone: Pentan-2-one (Hydration)

b) Alkyl halide addition

c) Ester: Hexyl benzoate

d) Dehydration to alkene

14. Anode: Al, Cathode: Pb

Reaction: $\text{Al} + \text{Pb}^{2+} \rightarrow \text{Al}^{3+} + \text{Pb}$

$E_{\text{cell}} = 1.66 - (0.13) = 1.79 \text{ V}$

15. a) Acid: Balanced using H_2O and H^+

b) Base: Use OH^- and H_2O for balancing

16. $\text{PbCl}_2 \rightleftharpoons \text{Pb}^{2+} + 2\text{Cl}^-$; $K_{\text{sp}} = [\text{Pb}^{2+}][\text{Cl}^-]^2$

Moles Pb = $0.170 / 207.2 = 8.21 \times 10^{-4}$

$[\text{Pb}^{2+}] = 0.0164 \text{ M}$; $[\text{Cl}^-] = 0.0328 \text{ M}$

$K_{\text{sp}} = 1.76 \times 10^{-5}$

17. Moles = $5/176 = 0.0284 \text{ mol}$ $\rightarrow [\text{HAsc}] = 0.114 \text{ M}$

Use K_{a} and ICE to find $[\text{H}^+] \sim 3 \times 10^{-3} \rightarrow \text{pH} \sim 2.5$

18. a) Strong base $\rightarrow \text{pH} \sim 13.3$

b) Use buffer equation: $\text{pH} = \text{pK}_{\text{a}} + \log\left(\frac{[\text{A}^-]}{[\text{HA}]}\right)$

c) Weak acid salt $\rightarrow \text{pH} > 7$

d) Half volume = 20 mL, $\text{pH} = \text{pK}_{\text{a}}$
